4	\$1,653,000	1	\$0	2/5	HIGH
Apps Assessed	Total Annual Spend	Apps Flagged	Potential Savings	EA Maturity Score	Overall Risk

Executive Intelligence Summary

The enterprise application portfolio of 4 systems carrying \$1.65M in annual spend presents an immediate opportunity to recover \$460K–\$670K annually through targeted elimination and migration actions, while simultaneously reducing a HIGH overall risk profile driven by a critically degraded Legacy Billing System. EA maturity is assessed at Level 2 (Managed), indicating that governance, data architecture, and integration standards must be formalized to prevent recurrence of technical debt accumulation and to sustain portfolio optimization gains long-term.

Financial Impact

Total Potential Savings	\$460,000–\$670,000 annually (net of replacement and migration costs)
Investment Required	\$265,000–\$425,000 one-time (Legacy Billing migration: \$250K–\$400K; monitoring replacement: \$15K–\$25K)
Roi Projection	110%–158% ROI within 24 months; payback period estimated at 9–14 months

Cost Breakdown	<pre>{'legacy_billing_migration_savings': '\$400,000–\$600,000/year post-migration after new platform licensing', 'legacy_billing_migration_investment': '\$250,000–\$400,000 one-time', 'old_monitoring_tool_elimination_savings': '\$60,000–\$70,000/year net (full \$85K recovery minus \$15K–\$25K replacement)', 'salesforce_license_optimization': '\$30,000–\$50,000/year', 'jira_cloud_migration_investment': '\$10,000–\$20,000 one-time (if applicable)', 'current_total_portfolio_spend': '\$1,653,000/year', 'projected_optimized_annual_spend': '\$983,000–\$1,193,000/year'}</pre>
----------------	--

Top Risks

Risk	Impact	Mitigation
Legacy Billing System operational and financial exposure	\$1.2M annual spend at 2.5/10 technical health with 8.5/10 integration depth creates active business continuity risk; system failure could directly disrupt revenue collection and billing operations	Immediately freeze new development, initiate formal migration project to cloud-native BSS platform (e.g., Zuora, BillingCloud), conduct full integration dependency mapping within 30 days, and establish parallel-run strategy targeting full cutover within 12 months
Old Monitoring Tool security and compliance gap	Lapsed vendor support (1.0/10) means unpatched vulnerabilities exist in monitoring infrastructure; absence of security patches propagates risk across the entire IT estate including Legacy Billing and Salesforce CRM	Immediate decommission within 30 days; deploy replacement observability solution (Datadog, Grafana, or Dynatrace) with a 2–4 week parallel-run period before full retirement; resolve 2 unidentified CMDB integration targets before cutover
CMDB data gaps creating hidden dependency risk	Two unresolved integration targets for the Old Monitoring Tool mean retirement could silently break alerting chains for higher-criticality systems including Legacy Billing System and Salesforce CRM	Prioritize CMDB remediation and manual dependency discovery before decommissioning Old Monitoring Tool; assign an integration mapping owner within 2 weeks

Atlassian Server/Data Center end-of-life obligation for Jira	If Jira remains on Server or Data Center deployment, Atlassian's cloud-first roadmap creates a forced emergency migration risk under end-of-life pressure, increasing cost and operational disruption	Proactively assess current Jira deployment model within 30 days and initiate cloud migration planning with \$10K–\$20K budgeted investment before EOL deadline
EA Maturity Level 2 governance gaps enabling future technical debt accumulation	Absence of a formal EA Governance Board, technology standards, and integration architecture framework means current portfolio problems (unchecked legacy spend, shadow IT, point-to-point integrations) will recur without structural remediation	Establish EA Governance Board with formal TIME decision framework and quarterly portfolio review cadence; implement EA repository tooling within 6 months

Quick Wins

Decommission Old Monitoring Tool within 30 days after a 2–4 week parallel-run with replacement tooling — recover \$85K annual spend with minimal disruption

Conduct Salesforce license utilization audit immediately — identify and reclaim unused licenses to capture \$30K–\$50K in savings within 60 days

Freeze all new feature development on Legacy Billing System starting immediately to halt acceleration of technical debt and redirect developer capacity to migration planning

Resolve 2 unidentified CMDB integration targets for Old Monitoring Tool via manual discovery sprint — unblock safe decommission path within 2 weeks

Assess current Jira deployment model (Server vs. Cloud vs. Data Center) within 30 days to determine EOL exposure and budget migration investment proactively

Stage 1 — Portfolio Rationalization (TIME)

TIME Classification Breakdown

TIME	Count	%	Description
INVEST	2	50%	High strategic value — continue and grow investment

TOLERATE	1	25%	Functional but not strategic — maintain, no new investment
ELIMINATE	1	25%	Decommission — retire or replace immediately

Application Detail

Application	Category	Annual Cost	Users	Score	TIME	6R	Confidence
Legacy Billing System	BSS	\$1,200,000	45	5.42/10	TOLERATE	Refactor	High
Salesforce CRM	CRM	\$320,000	380	8.0/10	INVEST	Retain	High
Old Monitoring Tool	Monitoring	\$85,000	8	2.15/10	ELIMINATE	Retire	High
Jira	ITSM	\$48,000	220	7.17/10	INVEST	Retain	High

Stage 2 — Dependency & Impact Analysis (MAPPING)

Overall Impact Level: LOW

Single low-criticality monitoring application flagged for elimination. Minimal dependency complexity with only 2 integrations and low business criticality. Straightforward retirement candidate with limited portfolio-wide risk. Primary concern is ensuring replacement monitoring coverage exists before decommissioning.

Per-Application Analysis

Application	TIME	Impact	Coupling	Direct Dependencies	Migration Sequence
-------------	------	--------	----------	---------------------	--------------------

Old Monitoring Tool	ELIMINATE	LOW	2/10	Unknown Integration Target 1 (unresolved - CMDB data absent), Unknown Integration Target 2 (unresolved - CMDB data absent)	First in migration sequence — act immediately as a quick win. Low criticality, low integrations, and a \$85,000 annual cost saving make this the highest-priority elimination candidate.
---------------------	-----------	-----	------	--	--

Recommended Migration Order

#	Application
1	Old Monitoring Tool

Cross-App Risks

Unresolved CMDB integration targets for Old Monitoring Tool introduce residual uncertainty — 2 unknown downstream consumers must be identified before retirement is finalized

If Old Monitoring Tool monitors Legacy Billing System (Critical) or Salesforce CRM (High), retirement without replacement monitoring elevates operational risk for those higher-criticality systems

Potential silent dependency on Jira for incident ticket creation — if not discovered pre-retirement, on-call alerting workflows may break without warning

Quick Wins (Lowest Coupling)

Old Monitoring Tool — lowest coupling score (2/10), lowest criticality (Low), only 2 integrations, and \$85,000 annual cost saving. Immediate retirement candidate pending replacement monitoring validation.

Stage 3 — EA Maturity Assessment (MATURITY)

Overall Score: 2/5 Level: Managed

Dimension Scores

Dimension	Score	Key Gaps
-----------	-------	----------

Governance	2/5	No formal EA governance board or review cadence evident, Portfolio health classified as 'Unknown' suggesting absence of governance oversight
Application Portfolio	3/5	Portfolio health remains 'Unknown' despite available data signals, Small portfolio of 4 applications limits breadth of rationalization insight
Data Architecture	2/5	No evidence of a formal data architecture framework or data governance structure, CMDB data is present but integration with portfolio and risk data appears siloed
Technology Standardization	2/5	No evidence of a formal technology radar or approved technology standards list, Coverage limited to 4 categories — standardization across broader tech stack is unknown
Integration Patterns	2/5	No evidence of standardized integration patterns or an integration architecture framework, Relationships between BSS, ITSM, Monitoring, and CRM applications are undocumented
Ea Adoption	2/5	EA practice appears to be project-initiated rather than continuously embedded, Portfolio rationalization exists but EA artifacts and models are not evidenced

Top Improvement Priorities

Establish EA Governance Board and formalize TIME decision framework to resolve 'Unknown' portfolio health status

Integrate CMDB, cost, and risk data into a unified portfolio health model with automated classification

Define and execute elimination plan for the 25% of applications flagged for elimination to recover cost

Maturity Improvement Roadmap

Phase	Key Actions
Phase 1 (0-3 months)	Stand up an EA Governance Board with at least monthly review cadence; Define formal portfolio health scoring criteria and reclassify current portfolio from 'Unknown'; Initiate decommissioning plan for the 1 ELIMINATE application with target completion date
Phase 2 (3-6 months)	Select and implement an EA repository tool to centralize architecture artifacts; Develop reference architectures for BSS, ITSM, Monitoring, and CRM domains; Publish enterprise Technology Radar with initial technology classifications
Phase 3 (6-12 months)	Expand application portfolio coverage to full enterprise scope beyond current 4 categories; Implement MDM strategy for application, infrastructure, and cost data domains; Establish quarterly technology standardization reviews linked to annual budget cycle

Stage 4 — Strategic Recommendations & KPIs (INSIGHTS)

Priority 1 — Immediately decommission the Old Monitoring Tool and deploy a replacement observability solution

Eliminates active security and compliance exposure from lapsed vendor support, recovers \$60K–\$70K net annually, and removes a risk vector that threatens higher-criticality systems across the portfolio. Highest return-to-effort ratio in the portfolio.

Effort: LOW • Timeline: 0–30 days

Priority 2 — Initiate a formal Legacy Billing System migration to a cloud-native BSS platform

Addresses the single largest financial and operational risk in the portfolio: \$1.2M annual spend at near-zero technical health. Post-migration savings of \$400K–\$600K annually eliminate the largest cost inefficiency while preserving maximum business value (10.0/10) and critical integration depth. Directly protects revenue continuity.

Effort: HIGH • Timeline: 12 months (dependency mapping in 30 days; parallel-run by month 6; full cutover by month 12)

Priority 3 — Execute Salesforce CRM license optimization and adoption expansion program

Captures \$30K–\$50K in immediate license savings through utilization audit and right-sizing, while expanding platform adoption (currently 7.0/10) unlocks incremental revenue impact through improved sales and service capability on an already high-performing platform (8.0/10 composite score).

Effort: LOW • Timeline: 0–6 months

Priority 4 — Establish an EA Governance Board with a formal TIME decision framework and quarterly portfolio review cadence

Addresses root cause of portfolio degradation: absence of governance enabled a \$1.2M legacy system to reach critical failure state without intervention. Formalizing governance with documented investment criteria, architecture review gates, and automated health classification prevents recurrence and provides executive visibility into portfolio risk in real time.

Effort: MEDIUM • Timeline: 3–6 months

Priority 5 — Remediate CMDB data gaps and implement an enterprise data architecture blueprint linking CMDB, cost, and risk data

Resolves the 2 unidentified integration targets blocking safe Old Monitoring Tool retirement, and addresses the broader EA maturity gap (data architecture score: 2/10) that currently prevents automated portfolio health classification and proactive risk detection across the full technology estate.

Effort: MEDIUM • Timeline: 3–6 months

Priority 6 — Proactively migrate Jira to Jira Cloud and evaluate CI/CD pipeline integrations to deepen platform value

Avoids forced emergency migration risk under Atlassian Server end-of-life with a modest \$10K–\$20K planned investment, maintains cost efficiency (\$218/user), and increases integration depth to further entrench Jira as a productive enterprise tool supporting engineering velocity.

Effort: LOW • Timeline: 3–6 months

Key Performance Indicators

Metric	Current	Target	Timeframe
Annual portfolio operating cost	\$1,653,000	\$983,000–\$1,193,000	18 months
Portfolio applications at ELIMINATE or critical technical health risk	2 (Old Monitoring Tool, Legacy Billing System)	0	12 months

Legacy Billing System technical health score	2.5 / 10	7.5+ / 10 (post-migration on new BSS platform)	12 months
EA Maturity Level	Level 2 – Managed	Level 3 – Defined	12 months
CMDB integration coverage completeness	Partial (2 unresolved targets identified)	100% integration targets documented for all portfolio applications	3 months
Salesforce CRM adoption rate	7.0 / 10	9.0 / 10	6 months
